

SuperPro Ezy Lift Kits Blue is best

This great new product from SuperPro is the ideal, cost effective way to obtain more ground clearance from a newer model 4WD utility.

Designed to work only with standard suspension, these new kits have been carefully designed to meet all vehicle modification requirements set down in current legislation, in all states and territories.

Each kit comes complete with everything required to get the optimum results from every application and maintains the factory “feel” and ride.

As is normal practise for SuperPro, each Kit has been meticulously designed and tested on each application, on all vehicles, to ensure a flawless fit and performance. All kits maintain suspension geometry, correct droop clearance, driveshaft angles

and rebound, all within the boundaries of VSB14. When these kits are fitted to a vehicle with standard suspension the installer and owner can be safe in the knowledge that everything complies.

These kits are ideally suited to a vehicle owner who wants more ground clearance but is reticent to change everything so early in the vehicles life. A SuperPro Ezy-Lift is designed, not to replace a traditional suspension lift kit, but to give cautious new vehicle owners a less intrusive option for increased ground clearance. The fitment of bigger wheels and tyres to these vehicles is often an option that is

considered first by vehicle owners, what better way to deliver more clearance than a SuperPro Ezy-Lift kit.

Many similar products exist in the market, but none are as comprehensively integrated into a single package as the SuperPro Ezy-Lift kit. Made from high strength, lightweight aluminium these products are another example of the SuperPro commitment to manufacturing products that are a complete solution and are carefully designed to deliver the right outcome, every time.
