

THE SHACKLE BUSHING

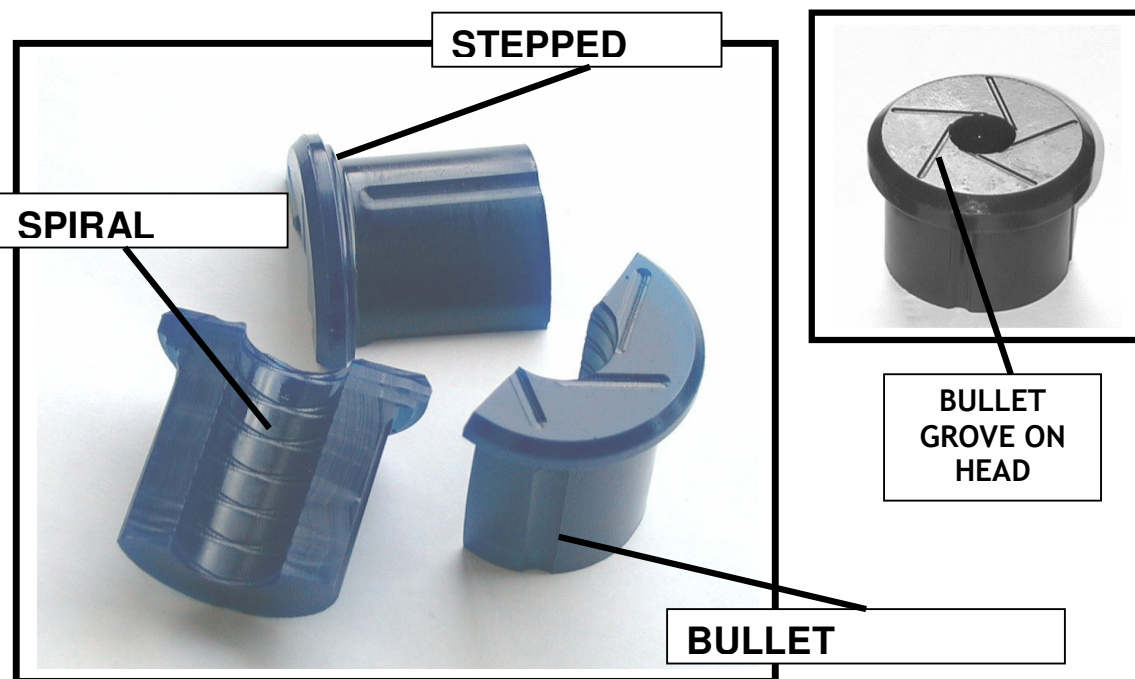

SuperPro is at the forefront of understanding and development of polyurethane bushings.

SuperPro was the first to use bullet grooves to give compliance and precise fitment.

SuperPro has added a series of features:

1. **Bullet grooved body** - allows the bush to fit a greater tolerance of eye sizes.
2. **Bullet grooved head** - minimises head friction, reduces noise and allows a precise fit.
3. **Spiral bore** - many shackles are now greaseable and this allows efficient transfer of lubricant.
4. **Stepped head** - allows for variation in aftermarket spring widths and side profiles.

SuperPro polyurethane suspension bushings offer a durable bushing material, positive location of suspension components and a reduction in variations of thrust angles and suspension geometry changes.
