

SuperPro Camber Bolt

SuperPro has released a range of adjustable Camber Bolts to suit a wide range of vehicles fitted with Chapman Strut suspension.

Camber Correction Bolt kits are a simple solution to provide camber adjustment.

This ability allows alignment correction that would have otherwise been unobtainable with stock hardware.

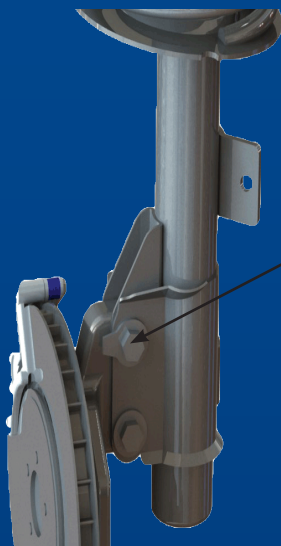

Incorrect camber settings have dramatic effects on factors such as tyre wear and the handling performance of the vehicle.

The Camber Bolts replace the standard upper clevis bolt, as per the diagram, and are a “cam” style bolt that pivots the top clevis inward or outward to gain the desired camber correction.

Each kit comes supplied with two bolts to replace the standard bolts on each side of the vehicle.

All fitment application information on our adjustable camber bolts is now available in our online catalogue.

Visit www.superpro.com.au/trade for more information.
